1. Functional Requirements

ReqId	Type	Description	Priority	Acceptance	Rationale
FR-001	Functional	The system shall allow public participants to view projects available for public voting.	High	The system displays all projects eligible for public voting and allows a participant to select a project to view its details.	Participants must be able to review eligible projects before casting a vote.
FR-002	Functional	The system shall allow a public participant to cast a vote for an eligible project.	High	When a participant selects an eligible project and submits a vote, the system records the vote and displays a	Public voting is a core feature of the project showcase application.

				confirmatio nmessage.	
FR-003	Functional	The system shall validate each public vote before recording it.	High	The system records a vote only if it passes the defined validation checks and rejects invalid or duplicate votes with an appropriate message.	Vote validation helps prevent duplicate or fraudulent voting and supports fair public participation.
FR-004	Functional	The system shall update the vote count of a project after a valid vote is successfully recorded.	High	After a valid vote is recorded, the selected project's vote count is updated and reflected in the project results or leaderboard.	Updating voter results ensures that public voting is accurately reflected in the showcase results.
FR-005	Functional	The system shall detect and reject invalid or suspicious	High	When a voting attempt fails the defined	Rejecting invalid or suspicious votes protect the

2. Non-Functional Requirements

ReqID	Type	Description	Priority	Acceptance	Rationale
NFR-001	Non-Functional	The system shall ensure that public voting is protected against unauthorized and duplicate voting attempts.	High	The system prevents a participant from successfully submitting more votes than permitted and rejects unauthorized voting attempts.	Secure voting is necessary to maintain the fairness and integrity of the public voting process.
NFR-002	Non-Functional	The system shall process and confirm a	Medium	Under normal operating conditions,	A responsive voting process

3. UML Use-Case Diagram

4. Use-Case Flow Specification

Use Case ID: UC-03

Use Case Name: Evaluate Project Primary

Actor: Panel Judge

Preconditions

1. The Panel Judge has access to the system.
2. The project has been submitted by a Student Team.
3. A digital evaluation rubric is available.

Main Success Scenario:

Step	Action
1	The Panel Judge logs into the system.
2	The system authenticates the Panel Judge.
3	The system displays the projects available for evaluation.
4	The Panel Judge selects a project.
5	The system displays the project's showcase information and submitted artifacts.
6	The system displays the applicable digital evaluation rubric.
7	The Panel Judge reviews the project and its submitted artifacts.
8	The Panel Judge enters the required rubric scores.
9	The system validates that all required evaluation fields have been completed.
10	The Panel Judge submits the evaluation.
11	The system records the evaluation and calculated score.
12	The system displays an evaluation submission confirmation.
13	The use case ends successfully.

Postconditions

1. The submitted project evaluation is recorded in the system.
2. The evaluation result is available for the project.

Alternate Flow A1: Incomplete Evaluation

A1: Incomplete Evaluation Detected

- a. If the system detects that one or more required rubric fields are incomplete, the system prevents submission of the evaluation.
- b. The system highlights the incomplete rubric fields.
- c. The system displays an appropriate message informing the Panel Judge that all required fields must be completed.
- d. The Panel Judge enters the missing information and the system validates the evaluation again.
- e. If all required fields are complete, the flow continues at Step 10 of the Main Success Scenario.
